This one-day workshop provides essential understanding for engineers associated with UK and EU projects that bring about changes to the rail industry and who wish to understand how the CSM should be applied. It provides a background to the legal obligations for compliance and practical guidance on how compliance for straightforward projects should be approached. A short e-learning course is included for delegates to complete before the workshop.
COURSE OVERVIEW
The e-learning course provides underpinning knowledge on policy, regulation and standards. Delegates are required to complete this package before attending our classroom-based workshop. It can be accessed from laptops or tablets. The course takes approximately two hours to complete and is interspersed with topic questions to check understanding. The e-learning package also provides useful links to reference material, including Network Rail, ORR and RSSB guidance, that can be used as support after the course.

The one-day classroom-based course is a learner-centred blend of lectures and workshops where delegates work in groups, supported by our subject matter experts. First, they review and reflect on their understanding of CSM Risk Assessment (CSM RA) principles and concepts gained from the e-learning package. They then develop and expand this underpinning knowledge through practical application of the principles and concepts in realistic and workplace-relevant contexts.

TOPICS COVERED
- Safety basics (terms and concepts)
- Overview and essential concepts of the CSM RA
- Significance test and system definitions
- Hazard identification and the selection of risk acceptance principles
- Safety requirements and demonstration
- Hazard records
- Safety justification

TRAINING DETAILS
This one-day course will take place at the RINA Consulting training suite in Leatherhead.

RELATED COURSES
Common Safety Method: Practitioner competence - two-day course.

What is special about this training course?

This one-day workshop is the first part of our complete CSM RA training but it stands alone to provide solid understanding of the CSM RA principles and its application.

Developed in close collaboration with Network Rail, the course provides a very sound introduction to the application of CSM RA for straightforward projects. Uniquely, the course describes the fundamental principles but also suggests practical strategies for their implementation.
